

Conclusion: Better Grading, Brighter Future

Our C++ system makes school reports much easier. It's fast, correct, and simple for teachers to use.

Easier and Faster Reports

The system makes getting grades ready much simpler and quicker for school staff.

More Correct and Dependable

Because fewer people touch the grades, there are fewer mistakes. This means all school records are right and can be trusted.

Helping Teachers

Teachers save a lot of time. This lets them spend more time teaching, talking with students, and helping each student in their own way.

Good Things About This Automatic System

Saves Time

This system greatly cuts down the time spent on checking grades by hand. This lets teachers focus on more important tasks.

Fewer Mistakes

It makes sure there are fewer human errors. This means student records are correct and trustworthy.

Works for Many

The system is built to handle any number of students and subjects easily. It can be used again and again.

Ready for Tomorrow

It's easy to add new features or make changes, like tracking attendance or using different grading rules.

Simple Code for Student Grades

```
#include<iostream> using namespace std;

class Student { int roll, m1, m2, m3, total; char grade;

public: void getData() { cout << "Enter Roll No: "; cin >> roll;
cout << "Enter 3 Marks: "; cin >> m1 >> m2 >> m3;
```

```
    total = m1 + m2 + m3;

    float avg = total / 3.0;
    if (avg >= 90) grade = 'A';
    else if (avg >= 75) grade = 'B';
    else if (avg >= 60) grade = 'C';
    else if (avg >= 40) grade = 'D';
    else grade = 'F';
}

void showData() {
    cout << "Roll: " << roll
        << " Total: " << total
        << " Grade: " << grade << endl;
}

void saveToFile() {
    ofstream out("student.txt", ios::app);
    out << roll << " " << total << " " << grade << endl;
    out.close();
}

static void viewFile() {
    ifstream in("student.txt"); int r, t;
    char g; while (in >> r >> t >> g) {
        cout << "Roll: " << r << " Total: "
            << t << " Grade: " << g << endl;

    }
    in.close();
}
```

```
};

int main() { int ch; do { cout << "\n1. Add Student\n2. View
Records\n3. Exit\nEnter Choice: "; cin >> ch;
```

```
    if (ch == 1) {
        Student s;
        s.getData();
        s.saveToFile();
    }
    else if (ch == 2) {
        Student::viewFile();
    }
} while (ch != 3);

return 0;
```

```
}
```

```
Student
Espirate exymnt class, ()++
student ()

> private members ("readess")

< Student stembers'(nt1/:>")

{
    < withl ++ al excprised = student clls;
    withll auto driyent class';
}

private members (lessentionl (7 ());

= {()
    <= lefildett haw camy optirimates, and student (i3",
    whilek student<class (//);
    <= in student's rase in student class."
    whilek he wrive studentti(e;)}
}
```

How Our System Works: A Step-by-Step Workflow

Data Input

Easily enter student names, IDs, and subject marks into the system.

Automated Calculation

The system instantly calculates total marks and averages for all subjects.

Automatic Grading

Grades are assigned automatically based on predefined, flexible grading scales.

Report Generation

Comprehensive student reports are generated, ready for review and sharing.

Our Solution: The Student Class

All Student Info in One Place

The `Student` class holds all important student details like name, student ID, class, and scores for each subject.

Automatic Grading

It has special features that automatically add up total scores and give grades based on rules we set up.

Flexible Grade Scale

It uses a grading scale like: A (90% and up), B (75-89%), C (60-74%), D (50-59%), and F (below 50%). You can easily change these rules.

The Problem: Making Student Reports by Hand

Easy to make mistakes

→ Takes too much time →

Teachers spend many hours adding up scores and grades for each student. This takes away time they could use for teaching.

When done by hand, it's easy to make errors in calculations and records. This can lead to wrong grades on student reports and disagreements.

→ Clunky ways of working

We need a better, simpler, and reliable way to create student reports. This will make sure all reports are correct and consistent.

Making Student Grade Management Easier with C++
